

220A Homework 2

1. Show that if $F(x) = P(X \leq x)$ is continuous then $Y = F(X)$ has a uniform distribution on $(0, 1)$, that is, if $y \in [0, 1]$, $P(Y \leq y) = y$.

Hint. F may not have a (classical) inverse. Define the generalized inverse

$$F^{-1}(y) := \inf\{x \in \mathbb{R} : y \leq F(x)\}.$$

Relate the event $\{F(X) \leq y\}$ to events of the form $\{X \leq F^{-1}(y)\}$. Use continuity of F to show that $F(F^{-1}(y)) = y$ for $y \in (0, 1)$. Consider separately the cases: (a) $y \in (0, 1)$; (b) $y = 0$; (c) $y = 1$.

2. Let $(\Omega, \mathcal{A}, \mu)$ be a measurable space. Let f_1 and f_2 be real-valued measurable functions on Ω . Suppose that f_1 and f_2 are integrable on Ω and that

$$\int_A f_1 d\mu = \int_A f_2 d\mu \quad \text{for every } A \in \mathcal{A}.$$

Show that $f_1 = f_2$ almost everywhere on Ω .

Hint. Let $g = f_1 - f_2$. For $n \in \mathbb{N}$, consider the sets

$$A_n = \{g > 1/n\}, \quad B_n = \{g < -1/n\}.$$

Show that neither A_n nor B_n can have positive measure, and conclude that $g = 0$ almost everywhere.

3. Let $(\Omega, \mathcal{A}, \mu)$ be a measurable space. Let f be a real-valued, non-negative, bounded measurable function on Ω . Show that for any $p \in (0, \infty)$,

$$\int_{\Omega} |f|^p d\mu = \int_0^{\infty} p\lambda^{p-1} \mu(\{\omega \in \Omega : |f(\omega)| > \lambda\}) d\lambda.$$

Hint. First verify the identity when f is an indicator function. Extend it to simple functions using linearity of the integral. Finally, pass to general bounded nonnegative f using a monotone (or bounded) convergence argument. Explain briefly why each extension step is valid.

4. Evaluate the limit

$$\lim_{n \rightarrow \infty} \int_0^1 (1 - e^{-x^2/n}) x^{-1/2} dx.$$

Hint. You may use a convergence theorem (Dominated/Monotone). A closed-form antiderivative is not expected. You may find it useful to note that

$$0 \leq 1 - e^{-x^2/n} \leq \frac{x^2}{n}.$$
